# SPRINT 4 Project Deliverables (Flask Code & Deployment)

Team ID	PNT202022TMID35159
Project Name	Efficient Water Quality Analysis & Prediction using Machine Learning

#### App.py:

```
▷ ∨ • □ □ □ ···
app.py X Water_quality.ipynb
                                                   water_potability.csv

    app.py > Python > 
    hello

 from flask import Flask, request, render_template
     import pickle
     import pandas as pd
 4 import numpy as np
 5 import joblib
     scaler = joblib.load("my_scaler.save")
     app = Flask(__name__)
     model = pickle.load(open('model.pkl', 'rb'))
 12 @app.route("/home")
      pp.route("/")
14 def hello():
@app.route("/predict", methods = ["GET", "POST"])
     def predict():
         if request.method == "POST":
             input_features = [float(x) for x in request.form.values()]
             features_value = [np.array(input_features)]
             feature_names = ["ph", "Hardness" , "Solids", "Chloramines", "Sulfate",
                             "Conductivity", "Organic_carbon", "Trihalomethanes", "Turbidity"]
             df = pd.DataFrame(features_value, columns = feature_names)
             df = scaler.transform(df)
             output = model.predict(df)
             if output[0] == 1:
                prediction = "safe"
                prediction = "not safe"
```

The flask file (app.py) which we have used as a framework which will present (home.html) file to user and model.pkl file to use the trained model to predict whether the water is safe for consumption or not

```
app.route("/predict", methods = ["GET", "POST"])
def predict():
   if request.method == "POST":
      input_features = [float(x) for x in request.form.values()]
      features value = [np.array(input features)]
       feature_names = ["ph", "Hardness", "Solids", "Chloramines", "Sulfate",
                        "Conductivity", "Organic_carbon", "Trihalomethanes", "Turbidity"]
       df = pd.DataFrame(features_value, columns = feature_names)
       df = scaler.transform(df)
      output = model.predict(df)
       if output[0] == 1:
           prediction = "safe"
           prediction = "not safe"
       return render_template('home.html', prediction_text= "water is {} for human consumption ".format(prediction))
  __name__ == "__main__":
   app.run(debug=True)
```

To run our ML model, we have to run **app.py** model where it gives a port number in terminal. We have to copy and paste that link in our browser to use the prediction model

#### **OUTPUT:**

## **Water Quality prediction**

#### By PNT202022TMID35159
